How to Act During LANDSLIDES AND MUDFLOWS

The greatest risk of landslides occurs during heavy and prolonged rains, especially when the soil is saturated with water

Follow information from official communication channels

Watch for unusual environmental sounds (cracking trees or rocks), sudden changes in water level, and visible changes in the ground surface

If you notice any changes, call 112

Provide help to those in need

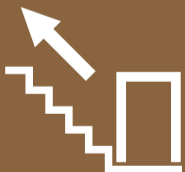

Wait for further instructions

If you are indoors:

If you are outdoors:

Stay as far away as possible from potential danger areas and remain on higher floors

Take shelter under a sturdy piece of furniture

Move out of the path of the landslide and mudflow

Find the nearest elevated area outside the landslide and mudflow path

If escape is not possible, take cover behind a group of larger trees or another solid mass
